Education

Mahidol University Aug 2024 – Present
Bachelor of Engineering Program in Computer Engineering *GPA: 3.90*

Experience

Western Digital, Internship Jun 2026 – Aug 2026
Manufacturing Engineer (Machine Learning / Computer Vision), AVI Vision Enhancement

- Built a YOLOv8 instance segmentation pipeline for automated visual inspection across 6 defect classes, achieving 45.3% mask mAP@50 on 142 held-out test images and GPU inference at 7.7 ms/image.
- Constructed a labeled defect dataset by hand-annotating 1,500+ production images across 6 defect classes using open-source annotation tooling. Established labeling documentation standards to ensure annotation consistency and enable dataset expansion.
- Communicated project progress, experimental results, and technical challenges to the engineering mentor and manager through weekly reports and discussions.

Head of Sponsorship Coordination, ClickCamp16 Core Team May 2025 – Dec 2025
Mahidol Engineering, Computer Engineering Department

- Led sponsorship strategy and relationship management for a university computing camp; secured 130,000 THB in funding.
- Contacted 200+ companies and built structured outreach-tracking workflows to manage the full sponsorship pipeline.

Piscine, 42 Bangkok School May 2024 – Jun 2024
42 School, KMITL

- Completed the intensive one-month selection program, delivering peer-evaluated C projects under strict deadlines with no formal instruction.
- Core topics: C programming, UNIX and shell, Git and version control.

Selected Projects

Space Fighter | Java, Swing, OOP, Multithreading, Event-Driven Programming

- Built a desktop arcade shooting game with player controls, automatic shooting, asteroid collision detection, upgrade mechanics, difficulty levels, and sound settings.
- Applied object-oriented design and concurrent programming by separating game entities into classes and using threads to manage asteroid spawning, bullet movement, and real-time gameplay.

Banana Ripeness Classification | ResNet34, PyTorch, scikit-learn

- Built a proprietary dataset from scratch by photographing bananas daily over 3+ months across their full ripeness lifecycle, capturing natural progression from fresh to rotten under real conditions.
- Iterated on class taxonomy through multiple relabeling experiments, testing different ripeness stage boundaries to maximize inter-class separability, improving F1-score to 87.5%.

HR Chatbot | Self-hosted n8n, Docker, Supabase (PostgreSQL), LLM, RAG

- Integrated the LINE Messaging API with an n8n POST webhook endpoint, containerizing the local environment with Docker Compose and configuring ngrok HTTPS tunneling for webhook testing.
- Built a RAG pipeline over HR policy documents with LLM-based intent extraction, handling multiple intent categories end-to-end.
- Developed PostgreSQL queries and JavaScript workflow logic for leave balance validation, request approval and cancellation, and Google Calendar integration, with interactive LINE Flex Messages.

Skills

Languages: Python, C, C++, Java, SQL, Rust, HTML / CSS
ML / CV: PyTorch, Ultralytics YOLO, OpenCV, scikit-learn, Pandas, NumPy
Systems & Tools: Docker, Git/GitHub, FastAPI, Linux, Supabase, Vercel, n8n
English: TOEIC 865 / 990 (CEFR B2)

Awards

2nd Place, Practice AI, Super AI Engineer SS5 (AI Innovator Track, Western Region) Summer 2025

Gold Medal, Onsite Presentation, Data Science Project Contest 2023, CMU Sep 2023
